

MEWS Development Program

Quality & Management — Portfolio Reference

1. Quality Management Approach

Quality management was integrated into project delivery through documented processes, requirements traceability, risk management, verification and validation, audit activities, competency management, training, and continual improvement.

2. QMS & Delivery Alignment

- Quality Management System (QMS) alignment
- Controlled documentation and records
- Requirements and traceability support
- Risk and issue management
- Verification and validation coordination
- Change and corrective-action support
- Audit readiness and evidence review

3. Quality Objectives Implementation

A documented quality-objectives initiative used a two-week implementation sprint.

Week 1 focused on discovery and feedback through team one-on-one sessions, validation of job responsibilities, blocker identification, and competency discussions.

Week 2 focused on analysis, objective drafting, management review, finalization, and readiness for rollout. The source plan defined objectives around measurable quality goals, QMS alignment, process gaps, and a formal team training and competency plan.

4. Competency & Training Management

Competency evidence included defined skill requirements, team-member performance assessment, and training-effectiveness evaluation.

Performance criteria covered scope, quality, schedule, cost, communication, collaboration, conflict management, decision making, and leadership.

Training effectiveness covered content, trainer performance, materials and methods, relevance to work responsibilities, application of learning, confidence, and overall satisfaction.

5. Internal Audit & Nonconformity Management

An internal audit identified a competency-management nonconformity involving alignment between skill requirements, job descriptions, performance evaluation, and training implementation.

The documented response included review of competency and job-description documents, training calendar updates, and clarification of evaluation frequency and process.

Corrective actions included defining a competency/training procedure and linking identified competency gaps to the training calendar.

6. Project Manager Contribution

The project-management role connected quality requirements with delivery execution by coordinating quality objectives, competency activities, audit follow-up, corrective actions, documentation, stakeholder review, and readiness activities across the project team.

7. Portfolio Evidence Boundary

This portfolio reference is anonymized and intentionally excludes company identifiers, employee personal information, controlled document numbers, confidential audit records, proprietary technical content, and other restricted QMS material.
