

Project Documentation

Medical Early Warning & Patient Monitoring Platform

Portfolio Reference Document | Documentation management and delivery evidence

1. Documentation Purpose

Project documentation supported development, manufacturing, quality, validation, operations, and cross-functional coordination. The documentation approach emphasized clear ownership, revision awareness, traceability, and practical use by engineering, quality, operations, and project stakeholders.

2. Documentation Model

Documentation Area	Purpose	Typical Outputs
Project Management	Plan, track, communicate and control delivery	Plans, schedules, status reports, meeting records, decisions
Requirements	Define product and technical expectations	Requirements, specifications, acceptance criteria, traceability
Technical	Describe architecture, interfaces and implementation	Architecture, integration notes, technical references
Engineering / Manufacturing	Define build and production activities	Work instructions, assembly guidance, production flows
Quality / Compliance	Provide controlled quality and validation evidence	Quality records, verification / validation evidence, audit inputs
Issue / Change	Capture problems, impact and corrective actions	Issue summaries, improvement actions, change records
Handover / Operations	Support transition and continued operation	Handover notes, support references, operational documentation

3. Documentation Control

Control	Application
Ownership	Documents identify the responsible author, reviewer, approver, or functional owner where applicable.
Revision	Changes are tracked through revision history or updated versions to maintain document currency.
Effective Date	Controlled procedures and instructions identify when a version becomes applicable.
Traceability	Documents connect requirements, implementation, testing, quality, and release activities.
Accessibility	Documentation is organized so technical and non-technical stakeholders can locate the information needed for delivery.

4. Evidence Examples

Evidence Type	What It Demonstrates
Technical architecture	System components, deployment model, service boundaries, interfaces, and infrastructure coordination.
Production flow	End-to-end operational flow from design/procurement through inspection, assembly, testing, shipment, and support.
Issue summary	Identification of technical issues, impact, recommendations, and follow-up actions.
Work instruction	Formalized assembly guidance, revision history, responsibility, and controlled technical procedures.
Project schedule	Work breakdown, milestones, dependencies, sequencing, and delivery tracking.

5. Documentation Lifecycle

Step	Activity	PM Focus
1	Capture	Identify the need for a document or record
2	Define	Agree purpose, audience, owner, inputs, and expected output
3	Review	Coordinate technical, quality, operational, or stakeholder review
4	Approve	Confirm readiness for use where formal approval is required
5	Maintain	Track revisions, changes, issues, and document currency
6	Release / Use	Ensure the right version reaches the intended users
7	Archive / Transition	Preserve records and transfer ownership at project closure

6. PM Documentation Responsibilities

- Translate delivery needs into documentation requirements and useful project records.
- Coordinate contributors across engineering, software, quality, operations, and other stakeholders.
- Keep project documentation aligned with scope, dependencies, risks, decisions, and readiness.
- Ensure issues and changes are recorded with enough context for follow-up and accountability.
- Support transition by ensuring documentation, ownership, and outstanding actions are visible.

7. Documentation Quality Principles

Principle	Expected Result
Clear	A reader can understand the purpose and expected use without relying on undocumented context.
Traceable	Important decisions and delivery outputs can be connected to requirements, tests, or actions.
Current	The active version is identifiable and obsolete material is not confused with current guidance.
Actionable	Documents help teams perform work, make decisions, resolve issues, or verify outcomes.
Fit for Purpose	The level of detail matches the audience and the risk of the activity.

Portfolio Reference Note

This document is a portfolio reference artifact derived from project documentation patterns and available project records. It is not an official controlled company document.
