

Project & Objectives

Medical Early Warning & Patient Monitoring Platform
Portfolio Reference Document | Senior Project Manager

1. Project Purpose

The program focused on developing and maturing a connected medical monitoring solution combining wearable hardware, firmware, software applications, cloud services, data processing, and supporting clinical and operational activities.

2. Business Objectives

Objective	Intended Outcome
Patient Monitoring	Support real-time collection and monitoring of physiological measurements.
Early Warning	Support early identification of patient deterioration through clinical monitoring and scoring.
Connected Platform	Integrate wearable devices, gateway components, firmware, software, and cloud services.
Data Management	Collect, process, store, and provide access to monitoring data through the platform.
Clinical Support	Provide information and alerts supporting healthcare monitoring workflows.
Quality & Compliance	Develop within structured quality, software lifecycle, and risk-management processes.
Validation Readiness	Coordinate verification, validation, and clinical preparation activities.
Production Readiness	Progress the product toward manufacturing, certification, and commercialization readiness.

3. Solution Scope

Layer	Scope
Wearable Device	Physiological sensing, device electronics, enclosure, power, and communication.
Firmware	Sensor acquisition, device control, data handling, and communication functions.
Gateway / Connectivity	Device connectivity and transfer of monitoring information.
Cloud Platform	Backend services, APIs, storage, processing, and platform infrastructure.
Monitoring Application	Patient monitoring, visualization, alerts, and device-related functions.
Quality & Validation	Requirements, traceability, risk management, verification, validation, and quality activities.
Clinical / Regulatory	Clinical preparation, regulatory activities, and readiness workstreams.
Manufacturing	Supplier coordination, production preparation, inspection, and production readiness.

4. Project Delivery Objectives

- Translate product and business needs into structured requirements and delivery priorities.
- Coordinate multidisciplinary hardware, firmware, software, quality, clinical, regulatory, and manufacturing workstreams.
- Manage project scope, schedule, resources, risks, issues, dependencies, and stakeholder expectations.
- Align development activities with quality-management and software-lifecycle requirements.
- Coordinate verification, validation, clinical preparation, and production-readiness activities.
- Maintain visibility of blockers and decisions across the project lifecycle.

5. Project Outcome

The project established an integrated technology and product-development foundation spanning the device, firmware, software, cloud platform, quality system, validation, clinical, regulatory, and manufacturing workstreams.
